PROFESSIONAL SUMMARY

Senior Unity & C# Game Programmer with 5 years of experience in international teams, specializing in high-performance multiplayer and data-heavy systems for Mobile and PC (Steam). Proven track record leading architectural migrations, eliminating bottlenecks, and doubling FPS in AA titles. Specialized in state synchronization, advanced UI (UI Toolkit/uGUI), and backend pipelines.

SKILLS

- **Languages & Core Tech:** C#, Engine Architecture, Gameplay Systems, Scriptable Objects, Data-Oriented Design.
- **Architecture & Patterns:** SOLID Principles, Dependency Injection, State Machines, Factory, Command, Observer.
- **Multiplayer & Networking:** Mirror, Photon Fusion/Quantum, Netcode for GameObjects, State Synchronization, RPC Handling, Latency Mitigation, UGS (Lobby/Auth).
- **UI & Frontend Engineering:** UI Toolkit (Advanced Diegetic Interfaces), uGUI, IMGUI, Data-Driven UI Architecture.
- **Performance & Optimization:** CPU/GPU Profiling (Unity Profiler, Frame Debugger), Memory Management, Addressables, Asset Bundles, UniTask (Asynchronous Programming).
- **Graphics & Pipelines:** Scriptable Render Pipeline (URP/HDRP Migration & Optimization), Shader Graph, Custom Materials, Cinemachine.
- **Tools & Integrations:** Steamworks API, RESTful APIs (Swagger), Git/Git-Flow, CI/CD Pipelines, Custom Editor Tooling.

WORK EXPERIENCE

Senior Unity Developer (Contractor) - [BGNS Studios](#) - Serbia

May 2024 - Present

[Draft Fever Bowl](#)

- Acted as the primary frontend technical representative for an AA PC title, establishing architectural standards, conducting peer code reviews, and leading cross-department synchronization across frontend, backend, and simulation teams.
- Designed a data-driven drafting and scouting system using C#, Scriptable Objects, and Virtualized Lists to handle over 2,000 dynamic entities in real-time, doubling performance from 40 FPS to 80-100 FPS on critical screens.
- Directed a full Scriptable Render Pipeline migration (HDRP to URP), refactoring rendering-dependent systems and custom shaders to boost menu performance to 80 FPS and stabilize gameplay simulation from 20-30 FPS to a solid 60 FPS.
- Redesigned the runtime character assembly architecture using dynamic Skinned Mesh Renderer swapping, reducing initial game loading times by over 50% (from 1 minute down to 20-25s) and eliminating pre-loaded memory variants.
- Optimized a complex emblem and stadium customization system by implementing asynchronous processing via UniTask and semaphore synchronization, completely eliminating frame drops during live texture and camera capture generation.

[PIX Football Manager](#)

- Built highly interactive diegetic interfaces using UI Toolkit for a PC football manager title, architecting new layout flows and executing comprehensive revamps of legacy screens to deliver an intuitive user experience.
- Utilized Swagger UI to map and implement RESTful API endpoints (GET, POST, PUT, DELETE) within Unity, synchronizing player account data, balance sheets, and complex contract life cycles.

Mid-Level Unity Developer (Contractor) - [Triplano Games](#) - Brazil

Jul 2023 - Jul 2024

[Amazon Warriors](#)

- Authored a comprehensive, data-driven UI framework used across multiple mobile titles, implementing Object Pooling for procedural terrain and props to eliminate execution spikes and lock mobile gameplay at 30 FPS.
- Restructured legacy codebases under tight LiveOps deadlines to implement procedural level generation, biome transitions, and dynamic obstacle systems.
- Integrated monetization flows, advertisements, and telemetry via Unity Gaming Services (UGS), leveraging Remote Config and Analytics to drive player engagement.

Mid-Level Unity Developer (Contractor - Part-time) - [Advance Garde](#) - Brazil

Dec 2021 - Dec 2023

[Rogue Masters](#)

- Took ownership of a mature multiplayer architecture using Mirror (P2P) for an AA Steam title supporting 6 players/session, expanding client-server communication, RPC handling, and matchmaking/lobby systems.
- Refactored critical multiplayer codebases, redesigning the character assembly pipeline to use lightweight ID-driven updates instead of heavy synchronization, eliminating frame drops during real-time equipment changes.
- Resolved legacy engine-freezing bugs by implementing an asynchronous bootstrap/startup scene, organizing the initialization sequence for Steamworks API, SDKs, and backend services to increase game stability.
- Specialized in multiplayer gameplay replication (projectiles, AI behaviors, and physics trajectories), utilizing the Unity Profiler in advanced mode to diagnose and eliminate deep legacy exceptions and desynchronization bugs.

[UniqKiller](#)

- Expanded the weapon system for dedicated 12-player servers using Photon Fusion, developing multiplayer-ready weapons, implementing projectile trajectories for a grenade, and integrating asset pipelines for a sniper rifle.
- Configured and baked terrain NavMesh for competitive maps, ensuring seamless bot navigation and preventing stuck behaviors while optimizing performance to eliminate redundant pathfinding calculations.

[Pet Shop Fever](#)

- Scaled memory efficiency on a title with 1M+ downloads by architecting an additive-scene UI framework, streaming interfaces dynamically to minimize memory footprint on low-end devices.
- Achieved significant build size reductions and optimized loading times by transitioning the project's asset management workflow to Unity Addressables and Asset Bundles.

[Games By MaxPro](#)

- Worked on an existing custom hardware integration pipeline, building gameplay mechanics, menu flows, and UI systems that transformed external physical activity data streams into active in-game interactions.

LANGUAGES

Portuguese: Native | **English:** Professional proficiency (advanced) | **Spanish:** Beginner

EDUCATION

Bachelor of Technology in Digital Game Development - FMU, Brazil (Feb 2019 - July 2021)
